#### Abstract

A health screening was done in UNIMAS in August 2008 for 237 undergraduate students. Body mass index (BMI), waist circumference (WC) and blood pressure (BP) were measured for all subjects. Total cholesterol and glucose levels were checked for those who fulfilled the screening criteria. The proportion of participants with cardiovascular (CVD) risk factors was high. The strategies for health promotion should not only be targeted to the older community but also to the younger community. Keywords: Cardiovascular risk factors, university students, undergraduate. Lee PY, Ong TA, Muna S, Syed Alwi SAR, Kamarudin K. Do university students have high cardiovascular risk? A pilot study from Universiti Malaysia Sarawak (UNIMAS). Malaysian Family Physician. 2010;5(1):41-43

## INTRODUCTION AND METHODS

In Malaysia, cardiovascular diseases consistently accounts for $15-16 \%$ of all Ministry of Health (MOH) hospital deaths annually from 1995 to 2007. ${ }^{1}$ Modifiable risk factors of cardiovascular diseases are on the rise in the world as well as in Malaysia. In August 2008, a health screening was done for 237 UNIMAS undergraduate students to screen for modifiable risk factors. Consent for reporting these data was obtained from the participants. Demographic data, body mass index (BMI), waist circumference (WC) and blood pressure (BP) were obtained. 92 students with $\mathrm{BMI} \geq 23 \mathrm{~kg} / \mathrm{m}^{2}$ or other risk factors subsequently had total cholesterol and glucose measurement by finger prick technique using rapid measurement devices. The classification of obesity, BP, abnormal glucose and total cholesterol level is according to recommended guidelines. ${ }^{2-5}$ All data collected were analysed using SPSS version 17.0.

## RESULTS AND DISCUSSION

The mean age of the participants was 23.1 years ( $\mathrm{SD} \pm 2.3$, range 19-29 years). There were more female ( $69.6 \%$ ) than male (30.4\%) participants.

The percentage of overweight students ( $37.1 \%$ ) in this study is slightly higher than the reported findings of $30.1 \%$ in a study at a private medical school in West Malaysia. ${ }^{6}$ Another survey in Universiti Sains Malaysia using WHO criteria of $25 \mathrm{~kg} / \mathrm{m}^{2}$ for overweight, found that $12 \%$ of the students were overweight. ${ }^{7}$ If we use similar cut-off point, the proportion of students who were overweight was higher in our study (17.3\%). We found higher percentage of male students to be overweight compared to female students, which is comparable to other studies. ${ }^{6,7}$ WC was over the normal limit in $24.1 \%$ of the students screened ( $22.5 \%$ in males and $25.0 \%$ in females). NHMS III reported the prevalence of $4.5 \%$ to $11.5 \%$ for central obesity in age group 18 to 29 years. ${ }^{8}$

The BP was at the level of pre-hypertensive range in $42.9 \%$ of the students. This is higher than NHMS II prevalence of $37 \%$ which include older patients. ${ }^{9}$ The mean total cholesterol level for the participants ( $4.7 \mathrm{mmol} / \mathrm{L}$ ) was slightly higher than the mean of $4.5 \mathrm{mmol} / \mathrm{L}$ in NHMS III. ${ }^{8}$ Above normal limit of total cholesterol was observed in $21.3 \%$ of subjects, which is higher than the reported $5 \%$ to $10.1 \%$ hypercholesterolemia for those aged 18 to 29 years old in the NHMSIII. ${ }^{8}$ The mean glucose levels for the participants ( $5.9 \mathrm{mmol} / \mathrm{L}$ ) were higher than recommended in the screening guideline. ${ }^{4}$ The finding of

Table 1: Distribution of BMI and WC among undergraduate students

|  | Male | Female | Total |
| :--- | :---: | :---: | :---: |
| BMI $\left(\mathrm{kg} / \mathrm{m}^{2}\right)$ |  |  |  |
| Mean | $22.9 \mathrm{~kg} / \mathrm{m}^{2}(\mathrm{SD} \pm 3.49)$ | $22.2 \mathrm{~kg} / \mathrm{m}^{2}(\mathrm{SD} \pm 4.6)$ | $22.4 \mathrm{~kg} / \mathrm{m}^{2}(\mathrm{SD} \pm 4.3)$ |
|  | $\mathrm{N}(\%)$ | $\mathrm{N}(\%)$ | $\mathrm{N}(\%)$ |
| Underweight | $8(11.1)$ | $26(15.8)$ | $34(14.3)$ |
| Normal range | $30(41.7)$ | $85(51.5)$ | $115(48.5)$ |
| Overweight | $34(47.2)$ | $54(32.7)$ | $88(37.1)$ |
| Pre-obese | $29(85.3)$ | $38(70.4)$ | $67(76.1)$ |
| Obese I | $5(14.7)$ | $12(22.2)$ | $17(19.3)$ |
| Obese II | 0 | $3(5.6)$ | $3(3.4)$ |
| Obese III | 0 | $1(1.9)$ | $1(1.1)$ |
|  |  |  |  |
| WC (cm) | $81.5 \mathrm{~cm}(\mathrm{SD} \pm 8.6)$ | $74.3 \mathrm{~cm}(\mathrm{SD} \pm 10.8)$ | $76.5 \mathrm{~cm}(\mathrm{SD} \pm 10.7)$ |
| Mean | $\mathrm{N}(\%)$ | $\mathrm{N}(\%)$ | $\mathrm{N}(\%)$ |
|  | $55(77.5)$ | $123(75.0)$ | $178(75.7)$ |
| $<90 \mathrm{~cm}$ for men \& | $16(22.5)$ | $41(25.0)$ | $57(24.3)$ |
| $<80 \mathrm{~cm}$ for women |  |  |  |
| $\geq 90 \mathrm{~cm}$ for men \& |  |  |  |
| $\geq 80 \mathrm{~cm}$ for women |  |  |  |

Number of students for the parameters are different due to missing data.

Table 2: Distribution of blood pressure, glucose, and total cholesterol among undergraduate students

|  | Male | Female | Total |
| :---: | :---: | :---: | :---: |
| Blood pressure( mmHg ) |  |  |  |
| Mean systolic |  |  | $114.6 \mathrm{mmHg}(\mathrm{SD} \pm 12.4)$ |
| Mean diastolic |  |  | $74.3 \mathrm{mmHg}(\mathrm{SD} \pm 9.0)$ |
|  | N (\%) | N (\%) | N (\%) |
| Optimal | 17 (24.3)* | 83 (53.2)* | 100 (44.2) |
| Prehypertension | 38 (54.3)* | 59 (37.8)* | 97 (42.9) |
| Hypertension |  |  | 29 (12.8) |
| Stage 1 | 14 (20.0)* | 14 (9.0)* | 28 (12.3) |
| Stage 2 | 1 (1.4) | 0 | 1 (0.4) |
| Total cholesterol (mmol/L) |  |  |  |
| Mean |  |  | $4.7 \mathrm{mmol} / \mathrm{L}(\mathrm{SD} \pm 0.7)$ |
|  | N (\%) | N (\%) | N (\%) |
| <5.2 | 24 (80.0) | 48 (77.4) | 72 (78.3) |
| $\geq 5.2$ | 6 (20.0) | 14 (22.6) | 20 (21.7) |
| Blood glucose (mmol/L) |  |  |  |
| Mean |  |  | $5.9 \mathrm{mmol} / \mathrm{L}(\mathrm{SD} \pm 1.4)$ |
|  | N (\%) | N (\%) | N (\%) |
| <5.6 | 13 (43.3) | 34 (54.9) | 47 (51.1) |
| $\geq 5.6$ | 17 (56.7) | 28 (45.1) | 45 (48.9) |

[^0]48.9\% of the subjects having glucose levels above the normal limit is high. The selected samples of students with cardiovascular risk factors for the blood test may be a contributing factor for these findings. Furthermore, random capillary blood glucose and total cholesterol rather than serum fasting glucose and cholesterol were taken. This result may not be able to qualify as the diagnosis of diabetes and hypercholesterolemia among the participants.

This preliminary data showed high proportion of UNIMAS undergraduate students with modifiable cardiovascular risk factors and this problem necessitates further survey to determine the prevalence of major CVD risk factors and their trends over time among the students. This highlighted that the strategies for health promotion should not only be targeted to the older community but also to the younger community.

## ACKNOWLEDGEMENTS

We would like to acknowledge the Vice-Chancellor of UNIMAS and the Dean of Faculty of Medicine and Health Sciences, UNIMAS for their support for this health screening.

## Rosiglitazone increases heart failure and fracture

Home PD, Pocock SJ, Beck-Nielsen H et al. Rosiglitazone evaluated for cardiovascular outcomes in oral agent combination therapy for type 2 diabetes (RECORD): a multicentre, randomised, open-label trial. Lancet. 2009;373(9681):2125-35.
In a multicentre, open-label trial, 4447 patients with type 2 diabetes on metformin or sulphonylurea monotherapy with mean $\mathrm{HbA}_{1 c}$ of $7.9 \%$ were randomly assigned to addition of rosiglitazone or to a combination of metformin and sulphonylurea. After a follow-up of 5.5 years, $\mathrm{HbA}_{1 \text { c }}$ showed reduction in the rosiglitazone group compared to combination of metformin and sulphonylurea. Heart failure and fractures were also more common in the rosiglitazone group but acute myocardial infarction, stroke and total cardiovascular mortality were similar in both groups.
